

ABSTRACT OF THE DISCLOSURE

Disclosed is a portable communication apparatus capable of providing data input expandability and thus convenient usability. The portable communication apparatus includes a
5 main housing, a hinge axis extending across the main housing, a fixed housing fixed to a first peripheral portion of the main housing, the first peripheral portion being located at one side of the hinge axis, and a rotational housing rotatable about the hinge axis, the rotational housing being in contact with the fixed housing while surrounding the first peripheral portion of the main housing when the rotational housing is closed on the fixed housing, the rotational housing being
10 most distant from the fixed housing while surrounding a second peripheral portion of the main housing when the rotational housing is completely opened from the fixed housing.
